# NO DISRUPTION SECURE CLOUD MIGRATION

---

risual has been working with a long standing client in the Built Environment industry to aid its move to the Cloud. This in itself was a significant project and extremely business critical. The client couldn't risk any downtime, loss of data, or any generic pains that might come with a large project.

The main driver for wanting to complete a Cloud migration was to ensure the entire environment, across teams, and external parties which might need access, would be secure.

risual completed the Cloud migration, which had zero negative impact on the organisation, with no disruptions or pain. This was an extremely successful project, and the client was assured it's in safe hands with the risual team.

# PROVIDING A SECURE ENVIRONMENT FOR 5,000 EMPLOYEES

Following this, the client and risual worked together to consider the next steps in the security journey. As an organisation which employs over 5,000 staff and engages with several third parties, it desired to have a way of creating highly secure and highly confined environments for certain aspects of the organisation to operate from within.

The team working on the cloud migration project worked to design a secure environment, a concept which needed to be repeatable. The secure Microsoft 365 environment was created and implemented for internal staff to help encourage high collaboration across teams, and provide a secure environment for all work, document saving and sharing.

The way in which risual configured this environment has ensured that the client can simply raise a ticket with the Managed Services team, and request for another environment to be implemented – this can now be completed in a matter of hours from the original template.

# SECURE M365 CLOUD

Benefits from the Secure Microsoft 365 environment;

- Simple and time efficient to raise a request for a new environment and implement
- Significant levels of automation during this M365 environment process
- No additional cost or loss of human time during any future M365 environment implementations
- Entirely secure environment for all internal staff
- End users able to securely save, share and collaborate across all documents and devices
- No down time and no loss of data during the cloud migration

This is a really efficient project for the client, and has further ensured the entire environment is secure from any potential arising cyber-threats. The client took upon itself to undergo various rigorous security audits including an external PEN Test and the DART Test. A DART Test is the Defence Assurance Risk Tool, which has been introduced to enabled MOD to register, triage and determine approaches to ICT system security accreditation.

This test in itself is a major audit and highly recognised industry wide, thus further showcases the high level of security standards that are met across the entire organisation and environments.
